RESEARCH INTERESTS

My research is centered on harnessing the power of large pre-trained models or foundation models, such as GPT-3/4, to make them more interpretable, controllable, and data-efficient across a range of real-world problems. By infusing LLMs with knowledge -centric principles, I focus on the following key aspects to refine and adapt LLMs effectively:

- **Interpretability and Control**: Enhancing the interpretability and control of LLMs through coherence boosting, probabilistic reasoning, innovative prompting approaches, and knowledge-driven reasoning, ensuring their alignment with human values and responsiveness to relevant context.
- **Transfer and Adaptation**: Developing state-of-the-art techniques, such as multitask prompt tuning, to enable efficient knowledge transfer, representation, and fine-tuning of LLMs for diverse tasks and domains.
- **Solve real-world problems**: Applying my expertise in biomedical network analysis, medical relation prediction, and clinical data analysis to leverage foundation models for real-world applications, by unlocking the vast amount of domain knowledge encoded in models to further improve data efficiency, interpretability, and decision-making.
