## RESEARCH INTERESTS

I am interested in empowering current AI systems with more explicit and human-understandable knowledge, aiming to make them more generalizable, interpretable, and efficient. My research lies in the nexus of natural language processing, deep learning, and data mining, where I study a "full stack" of the **knowledge-centric AI** from ground up: acquisition, representation, and reasoning. My long-term research goal is to transfuse the strengths of human knowledge systems (e.g., intuitive physics, commonsense reasoning) to the next evolution of AI systems.

- **Knowledge Acquisition:** Structured knowledge extraction from text and graphs, Knowledge Graph construction, Knowledge distillation from language models
- **Knowledge Representation:** Word representation learning, Graph embedding learning, Graph neural networks, Commonsense concept learning
- **Knowledge Reasoning:** Multi-hop reasoning over text and graphs (KG reasoning, complex QA), Neuro-symbolic reasoning, Commonsense reasoning
- **Applications:** Natural language interfaces (dialogue systems, question answering), Controllable text generation, Clinical NLP (e.g., knowledge discovery on clinical notes), Bioinformatics
